OCD Automation Feasibility and Workflow Priorities

25 October 2026 · Custom supporting application · Internal operations and future branches

Recommendation: Target 25 of the existing opportunities: 20 core workflows and five additions after their individual integration and acceptance gates. Reuse the React office workspace, Hono/TypeScript backend and W01–W14 workflow families. The numbers below refer to the original 35 opportunities, not new services or duplicate features.

The strongest opportunities remove repeated entry, inbox searching, missing-document checks, roster follow-up and service-by-service financial preparation. The application should prepare evidence, execute supported approved changes and verify results. ShiftCare retains operational records; Xero and the confirmed payroll platform retain accounting and payroll.

Delivery group	Original opportunity numbers	Count
First core batch C1	1, 2, 3, 4, 5, 6, 8, 18, 19, 33	10
Second core batch C2	10, 11, 12, 14, 16, 21, 22, 28, 31, 32	10
Add after individual gates G	7, 9, 13, 15, 20	5
Later or native/manual L	17, 23, 24, 25, 26, 27, 29, 30, 34, 35	10

The selected 25 comprise five bounded automatic functions and 20 partial automations. An approved person, correct data source and supported native operation remain prerequisites. The five additions can move earlier when their gates pass; cancellation preparation is valuable early, but its full execution chain must not be declared complete prematurely.

Reading the feasibility levels

- **F:** Full automation of a defined check, calculation, routing or report. This does not automate the surrounding human decision. The selected F items are 1, 4, 12, 19 and 33; report generation in item 34 is also feasible but deferred as a dedicated workflow.
- **P:** Partial automation of preparation, execution after review, verification or coordination. Staff responsibilities are named for every item.
- **N:** Retain the native/manual business process and track only the handoff. Item 30 falls in this category.

Technical fit describes the scoped function, not production readiness. S/M/L effort means relative complexity, not a time or price estimate. The per-item assessment follows the six main sections; the CSV contains the same fields for filtering and planning.

Recommended workflow delivery

First core batch

1 screening; 2 enquiry collection; 3 ownership/triage; 4 missing information; 5 participant onboarding; 6 worker onboarding; 8 correspondence preparation; 18 document filing; 19 document checks; 33 task completion and handovers.

This batch addresses repeated entry, duplicated inbox attention, missing paperwork and reliance on the owners. Most work shares intake, extraction, native matching, documents and case ownership. Start with current sources and reviewed basic records. Telephone events remain staff-logged; HR, funding and payroll readiness remain separate from profile creation.

Second core batch

10 booking preparation; 11 scoped changes/read-back; 12 travel checks; 14 reminder replies; 16 replacement cover; 21 renewals; 22 invoice preparation; 28 hours/mileage preparation; 31 visit exceptions; 32 feedback and complaint follow-up.

These workflows address daily roster interruptions and recurring bookkeeper/payroll work. Financial preparation belongs in the core because it is a documented recurring burden. Its initial scope is complete-source checks and reviewed exceptions, using native exports; a direct Xero or payroll write connector is not required for that bounded deliverable.

Five additions after acceptance gates

Item	Why include it	Gate before expansion
7 stages/service details	Reduce premature activation and searches for approved hours.	Explicit native status mapping and an agreed authoritative source for hours.
9 communication history	Reduce searching and false assumptions about notification.	Approved channel coverage and distinct dispatch/failure/response evidence.
13 instructions	Reduce repeated copying and version confusion.	Description-only adapter, exact booking scope and native read-back.
15 cancellation	Prevent an active booking or incorrect travel charge after a cancellation.	Verified travel treatment before cancellation, partial-failure recovery and all required handoffs.
20 date corrections	Remove false expiry alerts without hiding genuine renewals.	Reviewed meaning, supported resource, correct date/null semantics and verification.

The deferred ten are not all technically infeasible. Dedicated HR history and reporting have lower initial value; credits, collection and payroll-side comparisons need additional authoritative integrations; native payroll completion should stay native; arrival remains optional. Returned-invoice evidence can already enter triage/billing cases without building a separate credit/reissue engine.

ShiftCare integration findings

The public API specification was retrieved on 25 October. It documents more than the current adapter implements. A published contract establishes a possible integration method; actual account access, enabled features, field semantics and accepted writes still require account trials.

Requirement	Published integration path	Practical implication
People and stages	Client/staff reads and create/update; client_status is documented.	Extend reviewed field whitelists. Native status changes are feasible; agreements and readiness still need evidence.
Booking checks and instructions	Shift reads/updates; description; recurrence field/pattern operations; availability patterns; leave and qualifications.	Initial scope can stay one occurrence. Availability patterns need date expansion and do not establish willingness.
Confirmation replies	Native SMS replies reach admin email; shift events are readable.	Reuse Graph ingestion and verify exact identity/occurrence. Keep native reminders instead of duplicating them.
Documents and expiry	Client upload/list/update/download; staff files and staff qualifications.	Current client PDF/text filing and selected metadata adapters are reusable; broader resources need accepted adapters.
Billing and pay preparation	Timesheets, notes, invoices and cursor-paginated invoiceable_items.	Build exception preparation around native evidence and pricing. The existing generic page reader is not an invoiceable-items cursor adapter.
Cover	Roster/leave/qualifications plus native job-board offers; posting creation is documented.	Use native offers/acceptance initially. A new posting adapter does not authorize accepting on a worker's behalf.

Cancellation ordering matters. The published shift-update contract restricts edits to cancelled shifts. Where travel cleanup is required, complete and verify it before cancellation or use an explicit verified native process. A cleanup success followed by a cancellation failure must remain an unresolved case.

Keep native finance transfer. ShiftCare documents invoice export to Xero drafts and timesheet export to draft timesheets, with staff/pay-item setup. Confirm the actual payroll platform. Xero accounting use does not establish Xero Payroll use. Live credit/payment comparisons need a direct authorized Xero read adapter, absent from the repository today.

Access and delivery. The API-key guide and pricing describe plan access differently, so confirm OCD's entitlement. No general SMS/chat send adapter is established by this review. Microsoft Graph can send mail with separate Mail.Send permission, but a 202 response is acceptance for processing, not proof of delivery.

Integrating the existing prototype

Keep the current office routes and shared workflow API. Represent the selected opportunities as named case types or scheduled checks within W01–W14, using common domain rules, evidence and native adapters. Browser-only demonstrations must remain distinguishable from authenticated server cases.

Existing component	Reuse	Required extension
React workspace and Hono API	Staff sessions, review screens and revision-checked actions.	Case-specific fields, branch permissions and a clear distinction between review completion and completed external work.
Workflow service	Source deduplication, approval hashes, leases, dispatch receipts and unknown-outcome reconciliation.	Parent cases and mandatory dependent actions; a completed native action must not close an unfinished communication/correction process.
PostgreSQL and evidence	Shared state and protected originals.	Separate growing cases/actions/history into indexed rows; deliberate migration; retention and recoverable backups.
Worker and schedules	Source polling, preparation, cutoffs and overdue marking.	Durable approved-action/verification jobs, bounded retries, failed-job handling and missed-run policy. Current execution is a staff API action.
Native collectors/adapters	Basic people, guarded occurrence changes, client filing and period reads.	Accepted new create/instruction/event/invoiceable adapters; larger scopes partitioned without approving incomplete data.
Graph	Authorized Inbox delta and original attachments.	Representative reply matching; permitted additional folders/outbound functions only when a selected scope needs them.

Use a mature job component in the custom application. Durable case history remains separate from job attempts and retention. API and worker can run separately from one codebase. A bounded poll/worker design is sufficient; a new microservice platform or second primary automation engine is not needed.

Before enabling native writes, validate actual account permissions and exact request/response formats. The present cancellation adapter lacks travel cleanup; native completion currently generates a separate communication job rather than an aggregate completion gate. Existing code supports the proposed direction, but those gaps are production delivery work.

Manual responsibilities and workflow acceptance

Decision or task	Why retain human or native ownership
Identity, consent, signatures and ambiguous source text	A draft extraction or candidate match is not sufficient evidence to change the correct person's record.
Worker suitability, willingness and participant preference	Availability evidence does not supply consent or create backup staffing capacity.
Cancellation money treatment, credits, disputes and tax	The application can assemble evidence and execute an approved supported action; the authorized reviewer determines treatment.
Leave, back pay, first-job travel and pay release	Rules/vendor details need confirmation; calculation, final approval and money movement remain with payroll.
Care, safety, complaints and employment findings	Factual exceptions support investigation; they do not establish clinical or personnel conclusions.
Unsupported native edits and unresolved vendor outcomes	Staff reconcile the actual record; another automatic write may duplicate or worsen the change.

Count a workflow as delivered only when its scoped automated output is accepted. A fixture, new screen, configured schedule or generated task alone does not establish a completed native business process.

- Name the trigger, approved source scope, owner, rules and expected output.
- Check source completeness and current identity/occurrence before acting.
- Bind approval to the exact source and proposed fields; edits invalidate stale approval.
- Test replay, conflicting changes, worker restart and lost API responses without duplicate effects.
- Verify native results independently and keep required child actions open until their evidence exists.
- Test permissions, unavailable sources, no-cover outcomes and unknown delivery; do not report a false all-clear.

Track staff handling/recovery time, correction count, overdue work and source/queue freshness during the pilot. Compare like cases before and after automation. No measured saving or production capacity is asserted by the feasibility ratings.

Sources and review scope

Current official integration references

- ShiftCare public API specification — reviewed contract for the methods and fields discussed; the accompanying API evidence file records the downloaded hash and selected operations.
- ShiftCare API key management and pricing — confirm actual entitlement with the account.
- ShiftCare reminders — native reminders and SMS reply delivery to admin email.
- ShiftCare client communications — native sending and reply behaviour, distinct from application API capability.
- ShiftCare Xero integration — existing invoice/timesheet transfer and setup requirements.
- Microsoft Graph message delta and sendMail — source ingestion and the distinction between accepted sending and delivery.
- Xero invoices and contacts — accounting reads and stable accounting IDs for future reconciliation.

Existing project evidence

- Original 35 opportunities and 96-item treatment matrix.
- W01–W14 use cases, implementation direction, and the earlier architecture assessment.
- Existing workflow map and execution lifecycle specification. These are dated conceptual references, not current account acceptance.

Current code reviewed includes application routing, automation handlers/service/store, the worker, Graph collection, native evidence collection, person mapping, document operations and shift operations. No live OCD account mutation was performed. The prior 24 October backend build and 47 isolated test passes remain local regression evidence; no new account or load acceptance is implied. The code evidence file records the reviewed source hashes.

The selection is a practical recommendation against documented pain points and integration effort. It does not establish a measured ranking of time savings. Each original number appears once in the feasibility matrix, with exact scope, remaining human work and an acceptance condition.

Opportunities 01 to 05

Plan: C1/C2 = core 20; G = five gated additions; L = later/native. **Level:** F = bounded automatic function; P = partial; N = native/manual. Effort is relative S/M/L.

Opportunity and fit	Automated scope and retained responsibility	Integration and remaining work
01 Service area screening C1 · F · Fit High · Effort S People can complete full intake paperwork before learning that OCD cannot serve their location.	**Automate:** Apply the approved coverage list before full intake and automatically route uncertain areas. **Staff:** Confirm actual capacity and exceptional locations. **Done:** Covered, uncertain and unconfigured postcodes produce the correct recorded outcome.	**Integration:** Application service-area configuration; no ShiftCare write is required. **Existing:** Public intake screening and W01 already exist. **Need/gate:** Approve the list and routing rules; retain uncertainty rather than rejecting negotiable areas.
02 Centralized enquiry collection C1 · P · Fit High · Effort M Website, email, telephone and coordinator referrals require separate monitoring and manual collection.	**Automate:** Collect website and authorized mailbox sources, preserve originals and deduplicate enquiries. **Staff:** Log unsupported phone/voicemail sources and resolve uncertain identities. **Done:** Repeated or changed sources create the correct case/version without duplicate enquiries.	**Integration:** Existing intake API and Microsoft Graph folder delta; ShiftCare client search supplies optional matches. **Existing:** Shared intake, Graph polling, immutable message IDs and attachment import exist. **Need/gate:** Test actual mailbox notifications, expired cursors, folder scope, attachments and source replay.
03 Enquiry ownership and prioritization C1 · P · Fit High · Effort S Several administrators can inspect the same message while another request remains unanswered or lacks an owner.	**Automate:** Assign configured owners and deadlines, detect overdue requests and suggest urgency and routing. **Staff:** Confirm urgency, sensitive routing and candidate invoice/booking identity. **Done:** Each request has one accountable next action; missed deadlines remain visible and owned.	**Integration:** Application cases; ShiftCare clients/shifts/invoices for record context where needed. **Existing:** W02 classification, real-owner validation and deadline marking exist. **Need/gate:** Add approved assignment/escalation rules and notification outcomes; current classification is a suggestion.
04 Missing information detection C1 · F · Fit High · Effort S Incomplete forms, unclear dates and missing supporting documents create repeated clarification work.	**Automate:** Run deterministic required-field, attachment and format checks and prepare missing-information tasks. **Staff:** Resolve ambiguous dates, verify authenticity and provide missing answers. **Done:** Incomplete, unsupported and ambiguous sources are flagged without invented values.	**Integration:** Application forms and local extraction; no native mutation is needed for the checks. **Existing:** Intake rules, original evidence, PDF/OCR and missing-field checks exist. **Need/gate:** Approve required fields and test representative forms. F applies to checking, not obtaining truthful answers.
05 Participant onboarding and profile updates C1 · P · Fit High · Effort M Staff copy information from forms and scans into participant records and must check for existing people.	**Automate:** Extract evidenced draft fields, show duplicate candidates and execute approved basic participant changes with read-back. **Staff:** Approve identity, consent, field values and separate service/accounting readiness. **Done:** The source and exact approved fields link to one verified native identity; replay creates no duplicate.	**Integration:** ShiftCare GET clients/client; POST or PUT clients using an explicit whitelist. **Existing:** W03 extraction, person mapping, gated create/update and read-back exist. **Need/gate:** Validate native intake feature fit, actual forms, mapped fields and account writes; preserve prospects until activation is approved.

Opportunities 06 to 10

Plan: C1/C2 = core 20; G = five gated additions; L = later/native. **Level:** F = bounded automatic function; P = partial; N = native/manual. Effort is relative S/M/L.

Opportunity and fit	Automated scope and retained responsibility	Integration and remaining work
06 Worker onboarding coordination C1 · P · Fit High · Effort M Worker information is re-entered and separate qualifications, access and payroll setup require chasing.	**Automate:** Prepare worker fields, execute reviewed basic staff changes and track screening/access/payroll handoffs. **Staff:** HR verifies qualifications, employment decisions and payroll readiness. **Done:** Approved basic staff data is verified and incomplete HR/payroll steps prevent readiness claims.	**Integration:** ShiftCare GET staff/qualifications; POST or PUT staff. Existing payroll setup stays separate. **Existing:** W04 staff adapters and a separate payroll checkpoint exist. **Need/gate:** Test role/invitation behaviour and readiness checks. A recorded onboarding status does not itself establish sign-in permissions.
07 Client stages and agreed service details G · P · Fit High · Effort M Staff search prospect and active lists and recover agreed hours or changes from emails and notes.	**Automate:** Track reviewed stage transitions and source-linked service hours/effective changes. **Staff:** Approve activation, service hours, funding implications and effective dates. **Done:** Only an approved transition changes the native stage; hours retain their authoritative source.	**Integration:** Published clients PUT includes client_status; agreed hours also need native service/fund evidence and booking links. **Existing:** New client mapping defaults to prospect; intake references exist. **Need/gate:** Extend the mapping whitelist for explicit stage transitions; define which native record owns agreed hours rather than creating a second editable agreement.
08 Correspondence preparation C1 · P · Fit High · Effort S Staff repeatedly write similar messages, sometimes omitting the person, service time, outcome or next action.	**Automate:** Prepare approved templates, validate recipients/context/attachments and record the communication handoff. **Staff:** Approve sensitive wording and send through the agreed channel. **Done:** A complete reviewed message reaches an owned handoff; no task is labelled as a delivered message.	**Integration:** Application templates and existing ShiftCare communication UI; Graph sending would require separate Mail.Send permission and implementation. **Existing:** W13 provides owned native handoffs, not automatic outgoing delivery. **Need/gate:** Implement reusable templates and checks. Do not depend on an unverified ShiftCare SMS/chat send API.
09 Communication tracking and history G · P · Fit Medium · Effort M Communication evidence is scattered and staff must separately establish whether someone was notified or responded.	**Automate:** Link supported communication references and distinguish dispatch, failure, response and checked native history. **Staff:** Resolve unsupported channels and verify actual acknowledgement when required. **Done:** Each status is backed by its own evidence, with unknown outcomes and failed delivery kept open.	**Integration:** Graph Inbox/Sent Items and authorized native references; ShiftCare shift events may corroborate specific service communications. **Existing:** W13 requires an actual communication reference; current Graph access is read-only Inbox ingestion. **Need/gate:** Agree channel coverage and add permitted Sent Items/failure evidence. A Graph 202 response is not delivery proof; universal cross-channel read receipts are not promised.
10 Booking preparation and availability checks C2 · P · Fit High · Effort M Staff copy booking details, clarify times and assess capacity; a free calendar slot may be personal time.	**Automate:** Prepare one-off booking drafts and check dates, times, roster overlap, leave and available patterns. **Staff:** Confirm suitability, worker willingness, participant agreement and native acceptance. **Done:** A reviewed one-off arrangement has a verified native result or an explicit native creation handoff.	**Integration:** ShiftCare shifts/staff/leaves/qualifications; published availability_schedules and POST shifts can extend the adapter. **Existing:** W08 checks existing occurrences; the current adapter has no new-booking create operation. **Need/gate:** Add a whitelisted one-off create adapter and explicit native IDs/defaults if API creation is included. Availability patterns need date expansion; free time is not willingness.

Opportunities 11 to 15

Plan: C1/C2 = core 20; G = five gated additions; L = later/native. **Level:** F = bounded automatic function; P = partial; N = native/manual. Effort is relative S/M/L.

Opportunity and fit	Automated scope and retained responsibility	Integration and remaining work
11 Booking change scope and verification C2 · P · Fit High · Effort M Staff clarify one-visit versus recurring changes and reopen bookings to check whether edits saved.	**Automate:** Preview change scope and verify a supported saved occurrence against approved fields. **Staff:** Approve occurrence/series scope and resolve group or locked bookings. **Done:** Only the approved scope changes; native mismatch, stale data and locks leave an owned exception.	**Integration:** ShiftCare GET/PUT shifts; published recurrence/shifts and recurrence/pattern operations need separately scoped adapters. **Existing:** Current snapshot, overlap and single-client/single-worker change/read-back controls exist. **Need/gate:** Keep initial writes to accepted occurrence scope. Series operations are published but not implemented in the existing adapter.
12 Travel checking and stale value detection C2 · F · Fit High · Effort M Travel distances, durations and blocks need manual checks and can remain outdated after booking or worker changes.	**Automate:** Calculate route estimates from verified inputs and automatically flag stale or infeasible travel. **Staff:** Verify ambiguous addresses and approve actual claims or scheduling decisions. **Done:** Changes to worker, address or preceding visit invalidate the estimate; no estimate becomes actual mileage.	**Integration:** ShiftCare roster/address reads plus existing Mapbox routing; no automatic km/pay write is required. **Existing:** Browser travel checking and route utilities exist. **Need/gate:** Move dependency fingerprints/checks to shared server records. F covers estimates and stale-value checks, not mileage entitlement.
13 Shift instruction maintenance G · P · Fit High · Effort M Staff open bookings to copy missing instructions and track revised wording in separate tools.	**Automate:** Find missing instructions and apply an approved version to explicitly selected native bookings. **Staff:** Approve wording, effective date and affected occurrences. **Done:** Selected editable bookings match the approved instructions without changing unrelated fields.	**Integration:** Published ShiftCare PUT shifts accepts description; recurrence/shifts also documents description. **Existing:** Prototype instruction examples exist; the production shift adapter only writes assignment/times. **Need/gate:** Add a description-only adapter, version/hash checks and read-back. Validate series behaviour and locked/cancelled records before bulk changes.
14 Participant confirmation monitoring C2 · P · Fit High · Effort M Staff inspect reminder replies daily and determine which visit and follow-up each response concerns.	**Automate:** Ingest native reminder replies, match exact occurrences and route confirmation/change/cancellation exceptions. **Staff:** Resolve sender/occurrence ambiguity and approve any resulting service mutation. **Done:** A clear reply routes once; ambiguous replies and silence never trigger automatic cancellation.	**Integration:** Native reminders send SMS replies to admin email; Graph collects them. GET shift events provides an additional documented source. **Existing:** W02 reply candidates and W06 reviewed routing exist. **Need/gate:** Test actual notification formats, mailbox routing, quoted replies and occurrence matching; add event reads if needed.
15 Complete cancellation handling G · P · Fit Medium · Effort L A worker may be notified while the booking remains active, and travel charges require separate correction.	**Automate:** Execute reviewed cancellation steps with separate verified travel, charge and communication outcomes. **Staff:** Approve cause, notice, actual travel and financial treatment; review locked or unsupported changes. **Done:** No untravelled charge remains incorrectly applied; partial or unknown outcomes stay open without duplicate dispatch.	**Integration:** ShiftCare shift reads/updates/cancel plus invoice/timesheet or invoiceable evidence; native communication handoff. **Existing:** W07 persists dispatch and verifies cancellation, but performs no travel/mileage cleanup. **Need/gate:** Add verified cleanup before cancellation where required. Cancelled shifts restrict later edits. Model cleanup-success/cancel-failure and block closure until required handoffs finish.

Opportunities 16 to 20

Plan: C1/C2 = core 20; G = five gated additions; L = later/native. **Level:** F = bounded automatic function; P = partial; N = native/manual. Effort is relative S/M/L.

Opportunity and fit	Automated scope and retained responsibility	Integration and remaining work
16 Absence and replacement cover coordination C2 · P · Fit High · Effort M Sickness and departures trigger urgent reassignment, travel review and individual participant decisions across affected services.	**Automate:** List disrupted services, prepare candidates, track offers/acceptance and each participant outcome. **Staff:** Choose suitable cover and confirm worker acceptance and participant preference. **Done:** Each affected service has a verified arrangement or owned no-cover outcome, with required communication.	**Integration:** ShiftCare shifts/staff/leaves/qualifications; native job board/offers. Published job_board_postings is a possible later adapter. **Existing:** W08 guards one-worker assignment; native matching/offers remain handoffs. **Need/gate:** Add shared cover-case dependencies and affected-service tracking. Keep offer and acceptance native until their adapters are accepted.
17 Factual absence histories L · P · Fit High · Effort M Managers search roster and communication records to reconstruct when a worker was absent and which services were affected.	**Automate:** Assemble factual absence dates, affected services and authorized references. **Staff:** Management resolves disputed facts and all employment interpretation. **Done:** A source-linked history is visible only to authorized reviewers; it makes no performance conclusion.	**Integration:** ShiftCare roster/leave/events plus approved staff-logged communication references. **Existing:** Generic evidence/cases exist; a complete absence-history view does not. **Need/gate:** Defer dedicated HR history until core absence coordination is accepted; define restricted access and corrections.
18 Document matching and filing C1 · P · Fit High · Effort M Files must be found across email and storage, matched to the right person and placed in the correct native location.	**Automate:** Match reviewed originals and upload supported client documents with metadata and independent verification. **Staff:** Confirm person, signature/version, category and permitted visibility. **Done:** The correct original is verified under the correct native person, category and access setting.	**Integration:** ShiftCare client documents/type/download APIs; approved download hosts. Staff filing stays an explicit handoff initially. **Existing:** Document upload, metadata checks and native-byte hashing exist for client PDF/text files. **Need/gate:** Validate actual document types, field/date formats and download hosts. Do not claim the adapter supports every staff file or image.
19 Document completeness and attachment checks C1 · F · Fit High · Effort M Staff inspect records individually for paperwork and follow up emails referring to missing attachments.	**Automate:** Compare configured required documents/attachments with complete available metadata and create specific exceptions. **Staff:** Assess signature, authenticity and documents held outside the visible sources. **Done:** Missing, present and unreadable/unknown evidence remain distinct and generate the right follow-up.	**Integration:** Graph attachments; ShiftCare client documents, staff_files and qualifications; approved requirement rules. **Existing:** Evidence files, document reads and attachment checks exist. **Need/gate:** Add requirement matrices and complete-scope results. F covers presence/metadata checks, not proof that a valid agreement exists or is absent everywhere.
20 Document date and expiry correction G · P · Fit High · Effort M Plan and agreement dates can be confused, while incorrect metadata makes non-expiring documents appear expired.	**Automate:** Prepare reviewed date/expiry corrections and verify accepted native metadata updates. **Staff:** Interpret document meaning and approve non-expiring classifications. **Done:** Only evidence-backed corrections suppress false alerts; genuine expiries remain visible.	**Integration:** ShiftCare client document PUT and staff_qualifications PATCH; general staff-file edits need a supported method or native handoff. **Existing:** Client metadata and staff qualification expiry adapters exist. **Need/gate:** Validate date/null/no-expiration response semantics. General staff-file expiry correction is not implemented in the current adapter.

Opportunities 21 to 25

Plan: C1/C2 = core 20; G = five gated additions; L = later/native. **Level:** F = bounded automatic function; P = partial; N = native/manual. Effort is relative S/M/L.

Opportunity and fit	Automated scope and retained responsibility	Integration and remaining work
21 Renewal and coordinator follow up C2 · P · Fit High · Effort M Genuine renewals and requests for updated dates, funding or supporting documents require repeated external chasing.	**Automate:** Detect genuine due/missing evidence, schedule owned renewal/coordinator tasks and retain responses. **Staff:** Verify received documents, funding/date meaning and completion. **Done:** A due item creates one owned follow-up, remains open until checked and survives a missed schedule.	**Integration:** ShiftCare documents/qualifications/fund context and native expiry reminders; application schedules/Graph responses. **Existing:** W12 scoped staff collection and review schedules exist. **Need/gate:** Reuse native reminder sending, repair metadata first, avoid duplicate alerts and implement missed-run recovery and escalation.
22 Invoice preparation checks C2 · P · Fit High · Effort M Staff compare service records individually and resolve coding, travel, tax-setting and unusual-invoice questions.	**Automate:** Prepare period billing exceptions from actual attendance, notes and native invoiceable/invoice data. **Staff:** Bookkeeper approves category, charge, tax and unusual treatment, then uses native export. **Done:** Complete period evidence produces traceable exceptions; no duplicate invoice/export or false all-clear occurs.	**Integration:** ShiftCare shifts/timesheets/progress_notes/invoices and published invoiceable_items; existing ShiftCare-Xero integration. **Existing:** W10 collects visit/invoice evidence; there is no invoiceable-items cursor adapter yet. **Need/gate:** Add cursor-aware pre-invoice reads and agreed rules/cutoffs. Use native pricing rather than calculating care billing rates in the application.
23 Special billing instructions and prepayments L · P · Fit Medium · Effort M Advance payments and special arrangements depend on staff memory and scattered notes.	**Automate:** Surface approved special instructions and verified Xero credit/prepayment references. **Staff:** Bookkeeper applies balances and approves accounting treatment. **Done:** Current accounting evidence is linked without automatic credit allocation or balance invention.	**Integration:** Xero OAuth and read permissions for accounting evidence, linked by organization/ContactID; native references in ShiftCare. **Existing:** Manual accounting references exist; no direct Xero connector exists. **Need/gate:** Defer live balance integration until authorized Xero access and ID reconciliation are implemented. Do not create another ledger.
24 Billing recipient verification L · P · Fit Medium · Effort M Plan-manager or payer changes may not reach staff before invoices are issued.	**Automate:** Flag payer/contact changes and compare current recipient instructions with linked native records. **Staff:** Staff verify authority and effective payer changes before updating billing. **Done:** A changed billing recipient has an authorized, effective instruction and verified native identity.	**Integration:** ShiftCare client/contact/invoice context; Xero contacts for full cross-system comparison. **Existing:** Basic participant contact updates exist; a payer-specific reconciliation adapter does not. **Need/gate:** Defer dedicated cross-system recipient automation; keep checks in existing onboarding/billing review until account mappings are verified.
25 Returned invoice resolution L · P · Fit Medium · Effort M Staff locate rejected invoices, investigate reasons and coordinate corrections across records and conversations.	**Automate:** Collect rejection correspondence, invoice/source references and correction ownership. **Staff:** Bookkeeper determines credit, correction or reissue and checks the result. **Done:** The reason and corrected native outcome are linked without a duplicate invoice.	**Integration:** Graph/staff-logged rejection evidence and ShiftCare/Xero invoice IDs; rejection reason is not guaranteed by invoice status alone. **Existing:** Mail triage and W10 review cases can already carry the evidence. **Need/gate:** Defer a dedicated correction/reissue automation; reuse #3/#22 cases and native accounting actions first.

Opportunities 26 to 30

Plan: C1/C2 = core 20; G = five gated additions; L = later/native. **Level:** F = bounded automatic function; P = partial; N = native/manual. Effort is relative S/M/L.

Opportunity and fit	Automated scope and retained responsibility	Integration and remaining work
26 Payment follow up L · P · Fit High · Effort M Calls, resending and payment checks require chasing, while unresolved invoices affect owners' cash planning.	**Automate:** Build verified overdue/payment follow-up from the authoritative ledger and approved communication rules. **Staff:** Bookkeeper approves disputes, escalation and any collection action. **Done:** Paid invoices stop further chasing and ambiguous/reversed payment states stay reviewable.	**Integration:** Xero invoice/payment status via new OAuth adapter; native ShiftCare due reminders where suitable. **Existing:** Follow-up cases exist; live Xero status ingestion is absent. **Need/gate:** Defer custom collection status until ledger IDs, tokens and reconciliation are accepted; do not treat a ShiftCare balance as verified Xero payment.
27 Pay period and employee checks L · P · Fit Medium · Effort M Staff check run dates, employee lists and carried-over values; inactive workers or unexplained prior values need review.	**Automate:** Check run periods, verified employee population and unexplained carried-over fields. **Staff:** Payroll confirms final-pay eligibility and the meaning of prior values. **Done:** Run dates/population reconcile and leavers needing final pay are retained.	**Integration:** ShiftCare staff/payroll fields plus the confirmed payroll platform API or approved export. **Existing:** Period review support exists; payroll vendor and employment-status source need confirmation. **Need/gate:** Defer payroll-side automation until the actual vendor/field mappings are known. Inactive ShiftCare access does not establish zero pay.
28 Timesheet hours and mileage reconciliation C2 · P · Fit High · Effort M Staff compare workers' hours and mileage with payroll inputs and investigate missing source timesheets.	**Automate:** Check ShiftCare period completeness, actual hours and mileage units, then compare approved payroll input where available. **Staff:** Payroll approves payable values and resolves discrepancies before native release. **Done:** Missing timesheets never become zero pay; approved quantities and units trace to their source and period.	**Integration:** ShiftCare timesheets/shifts/pay-item evidence; existing timesheet export and a confirmed payroll API/export for two-sided reconciliation. **Existing:** W11 and browser payroll review exist; a live payroll-system connector is not implemented. **Need/gate:** First deliver source checks and reviewed handoff. Add two-sided comparison only against the real export/API; do not claim automated payroll reconciliation without it.
29 Payroll adjustment tracking L · P · Fit Medium · Effort L Adjustments, leave, back pay and first-job travel decisions must be recovered from notes and applied to the right period.	**Automate:** Retain adjustment evidence, period, original/corrected values, approver and explanatory notes. **Staff:** Payroll calculates and approves leave, back pay and travel treatment in the established payroll process. **Done:** Each applied adjustment has the correct period, authorization and verified native result.	**Integration:** Approved payroll export/API, leave evidence and restricted application adjustment records. **Existing:** Browser adjustment worksheet exists; no production payroll calculation/write adapter exists. **Need/gate:** Keep calculations and native entry manual initially; support evidence through #28 rather than building an award/payroll engine.
30 Payroll completion handoffs L · N · Fit Native · Effort S Saving, finalizing and delivering payslips requires separate completion steps in the external payroll process.	**Automate:** Track the preparation handoff and unresolved items in the supporting application. **Staff:** Authorized payroll staff finalize the run, release payment and deliver payslips in the payroll platform. **Done:** Preparation is handed off with evidence; payroll completion retains its own native approval trail.	**Integration:** Existing payroll process and native integration; no custom release connector is required. **Existing:** Checked handoff references and review/export demonstrations exist. **Need/gate:** Retain finalization and money movement in the established platform; a duplicate release workflow adds little benefit and substantial risk.

Opportunities 31 to 35

Plan: C1/C2 = core 20; G = five gated additions; L = later/native. **Level:** F = bounded automatic function; P = partial; N = native/manual. Effort is relative S/M/L.

Opportunity and fit	Automated scope and retained responsibility	Integration and remaining work
31 Visit record and care exceptions C2 · P · Fit High · Effort M Missing notes, reported incomplete work, unusual durations and important events can be buried among routine records.	**Automate:** Detect factual missing/invalid attendance or notes, duration differences and source-defined significant events. **Staff:** Supervisors investigate quality, care and employment concerns. **Done:** A factual exception cites its original record and owner without making a clinical or misconduct conclusion.	**Integration:** ShiftCare shifts/timesheets/progress_notes; care_plan_tasks reads can add validated task context. **Existing:** W09 visit collection and factual exception preparation exist. **Need/gate:** Validate complete periods, staff-specific evidence and restricted access; task-specific completion comparisons need accepted source fields.
32 Feedback complaint and safety follow through C2 · P · Fit High · Effort M Feedback calls, complaint histories, pending responses and safety follow-up require coordination across several sources.	**Automate:** Schedule agreed feedback, retain authorized responses and track complaint/safety callbacks and corrective follow-up. **Staff:** Managers handle safety, complaint outcomes and personnel decisions; urgent procedures remain active. **Done:** Every response/action has an accountable outcome; restricted information stays within permitted access.	**Integration:** Staff-logged sources, Graph evidence and native record references; no automatic incident/complaint write is assumed. **Existing:** W09/W13 cases and handoffs provide a foundation; a feedback-specific shared case is additional work. **Need/gate:** Add restricted case fields, owners, follow-up schedule and explicit urgent escalation; avoid automatic clinical triage.
33 Task completion handovers and escalation C1 · F · Fit High · Effort M Unconfirmed times, incomplete steps, routine questions and future plans depend on memory or return to the owners.	**Automate:** Run configured assignment, deadline, handover and required-step completion checks automatically. **Staff:** People perform tasks and management supplies delegated authority and actual coverage. **Done:** A parent case cannot close while any mandatory child outcome remains incomplete or uncertain.	**Integration:** Shared application cases/actions/outbox; optional approved native action-item references. **Existing:** Owners, deadlines, dispatch records and individual follow-up jobs exist. **Need/gate:** Add parent-case dependencies, external notification outcomes and catch-up. Current native jobs can complete before their separate communication follow-up.
34 Operational outcome reporting L · F · Fit High · Effort S Uncovered services, uneven demand, recurring costs and administration pressure complicate operating decisions.	**Automate:** Generate factual period reports from complete case, enquiry and native service evidence. **Staff:** Management interprets staffing, cost and demand implications. **Done:** Reports state period, source completeness and actual outcomes; they make no unsupported savings or revenue claim.	**Integration:** Read-only application/ShiftCare aggregates; use native financial reports unless ledger access is accepted. **Existing:** Basic workspace counts exist; a reconciled cross-source reporting job does not. **Need/gate:** Keep baseline pilot measures in core instrumentation; defer a dedicated reporting workflow until daily work is stable. No forecast model is proposed.
35 Arrival visibility if the remaining gap is confirmed L · P · Fit Medium · Effort L Participants interrupt the office to ask whether their worker is on the way or delayed.	**Automate:** If a real native gap remains, show fresh consented ETA/status for the current assigned service. **Staff:** Approve access/consent and validate actual devices and withdrawal behaviour. **Done:** Only permitted current service access sees fresh status; reassignment or stale updates withdraw it.	**Integration:** ShiftCare current roster plus verified service identities, browser location and routing provider. **Existing:** W14 service identity, consent/freshness and ETA components exist. **Need/gate:** Defer optional arrival work pending native-feature fit and device/privacy trials; continuous background tracking is not established.
